

AGENTSABHA — एजेंट सभा

Functional Requirements Document | Version 2.0

Revised following independent governance, legal, and go-to-market review

Document	AgentSabha FRD v2.0	Status	Revised — March 2026
Version	2.0 — Post-Review Update	Supersedes	FRD v1.0 (March 2026)
Scope	India — 543 Lok Sabha Constituencies	New Sections	S11: Legal Posture S12: Governance S13: Security S14: Phase 1 Wedge

"543 AI Agents. One Parliament. A Billion Voices."

Key Changes in v2.0

Change	Description
Section 11 — ADDED	Legal posture: constitutional authority, IT Rules 2021 compliance, DPDP Act, Aadhaar/UIDAI constraints, blockchain immutability vs takedown obligations
Section 12 — ADDED	Governance & safety: human oversight roles, editorial independence vs legal accountability, pipeline kill-switch, hallucination control gates, bias audit
Section 13 — ADDED	Security & adversarial model: data classification tiers, encryption, threat model, hostile actor scenarios including state-level pressure
Section 8 revised	Phase 1 scope tightened to 3-constituency 'MP co-pilot' wedge; 'parallel parliament' branding deferred to Phase 3+
Section 7 revised	Revenue sequencing revised: financial sector and election intelligence moved to Phase 3+; civic trust verticals prioritised first
Strategic framing	'MP Co-pilot' positioned as Phase 1 identity; 'parallel parliament' earned through Phase 2-3 credibility, not announced at launch

1. Strategic Framing — The Critical Correction

v1.0 framing risk: Positioning AgentSabha as a 'parallel parliament' at launch is a political lightning rod. The moment a Speaker's office or ruling party characterises this as 'AI MPs,' you will face institutional blocking before you have proven anything. The technology does not change. The framing must.

1.1 The Positioning Shift

v1.0 Framing (Retire at Launch)	v2.0 Framing (Adopt for Phase 1–2)
"A parallel parliament of AI agents"	"The intelligence tool that makes India's MPs better at their jobs"
"543 AI agents replacing representative bandwidth"	"A co-pilot that surfaces what 2.7 million citizens need — so one MP can actually know"
"AI parliament that files questions and bills"	"Draft questions, Zero Hour notices, and briefs — ready for the MP to file with one click"
"Radical transparency — no human in the loop"	"Full audit trail — every claim sourced, every action logged, every citizen verified"
"AgentSabha holds MPs accountable"	"AgentSabha gives MPs the data to be more effective — and makes that data public"

The parallel parliament is what AgentSabha becomes after Phase 2. It is not what AgentSabha launches as. You earn the framing through demonstrated credibility — not by announcing it on day one.

1.2 Why This Framing Wins Politically

Three groups that can destroy AgentSabha early: (1) the Speaker's office, which controls parliamentary access; (2) the ruling party, which can frame it as foreign-funded AI interference in democracy; (3) all opposition parties, who can claim it is biased against them. The 'MP co-pilot' framing neutralises all three.

Stakeholder	Risk under v1.0	How v2.0 framing neutralises it
Speaker's Office	Blocks AI 'filings' as unconstitutional	Co-pilot produces drafts that MPs file — constitutional, always
Ruling Party	'Foreign AI interfering in Parliament'	'Tool that helps your MPs serve 2.7M constituents better'
Opposition Parties	'Biased against us / surveillance'	6-perspective framework steelmans all parties; data is public
Reformist MPs	Potential early adopters	Explicit value: 'Get credit for 2,500 questions instead of 200'

Civil Society	Scepticism of corporate AI in democracy	Open-source protocol, Dissent Agent, full audit trail
---------------	---	---

2–10. Core Document Sections

Sections 2 through 10 from FRD v1.0 remain substantively unchanged and are carried forward in full. The following revisions apply within those sections:

Section	Revision in v2.0	Reason
S2 — Product Vision	Brand voice guidelines updated: avoid 'AI parliament' in Phase 1 press materials	Framing correction (see S1)
S5 — Parliamentary Functions	All parliamentary outputs labelled 'drafts for MP approval' in Phase 1	Legal posture (see S11)
S6 — Media Engine	'No human in loop' revised to 'no human editorial interference' with compliance officer role defined	IT Rules 2021 compliance (see S11)
S7 — Revenue Model	Financial sector and election intelligence verticals moved to Phase 3+	Trust sequencing (see S7 revision below)
S8 — Roadmap	Phase 1 MVP tightened from 10 to 3 constituencies; new 'wedge loop' defined	Phase 1 sharpening (see S8 revision below)
S10 — KPIs	Phase 1 success metrics revised to match tightened scope	Consistency with S8 revision

7. Revenue Model — Revised Sequencing

The v1.0 revenue model is architecturally correct. The sequencing is wrong. Selling election intelligence and granular constituency sentiment to financial institutions before civic trust is established creates a reputational risk that can end the project. The revised sequencing:

Phase	Timeline	Revenue Verticals Active	Rationale
Phase 1	Q3 2025	Zero (trust-building only)	No monetisation before proving the core loop. One proven MP co-pilot result is worth more than 10 revenue projections.
Phase 2	Q4 2025–Q1 2026	MP Intelligence (₹50K/month), Journalist API (₹2-5L/month), YouTube/media revenue	These buyers reward civic credibility. MPs who see value adopt early. Journalists who get clean data renew. Both build the trust asset.
Phase 3	2026	Government Intelligence (B2G), Citizen Welfare (B2C), Academic/Think Tank, Corporate SaaS (non-sensitive)	State government contracts and corporate expansion intelligence are relationship sales — begin BD in Phase 2, close in Phase 3.
Phase 4	2027+	Financial Sector risk scores, Election Intelligence, Platform Licensing, Global Export	Only after civic trust brand is established and DPDP compliance framework is bulletproof. These are the highest-value and highest-scrutiny products.

8. Phased Roadmap — Revised Phase 1

v1.0 Phase 1 scope was too broad: 10 constituencies, 3 agents, public dashboard, GitHub launch, civil society partners, and media features in 12 weeks. That is 6 months of work for a small team. Revised Phase 1 focuses on one provable loop.

Phase 1 Wedge — The Single Provable Loop

The goal of Phase 1 is not to build a platform. It is to prove one thing: 'Citizen submits issue → AI clusters → MP gets draft question → MP files it → Citizen sees it in Parliament.' That loop, proven once, in public, is worth more than 100 slides.

Dimension	v1.0 Phase 1	v2.0 Phase 1 (Revised)
Scope	10 constituencies	3 constituencies (1 urban, 1 semi-urban, 1 rural)
Agent types deployed	Intake + Clustering + Question Hour	Intake + Clustering + Question Hour Draft only
Output framing	Questions filed to Parliament	Draft questions delivered to MP for filing
MP relationship	Target: 5 media features	Target: 1 confirmed MP co-pilot partner
Revenue	₹0	₹0
Dashboard	Full public dashboard	Minimal: constituency map + live issue ledger + question draft log
Media	No media engine	No media engine — Phase 2
Success metric (primary)	1,000 citizens; 50 questions filed	1 MP files 1 question derived from AgentSabha citizen data in a real Parliament session
Success metric (secondary)	3 media articles	10 journalists briefed; 1 article published explaining the co-pilot model
Timeline	12 weeks	8 weeks to demo-ready; 12 weeks to first MP filing

Phase 1 — Revised Build Order (8 Weeks to Demo)

Weeks	Task	Definition of Done
1–2	PostgreSQL schema + pgvector + seed 3 constituencies with census data	Schema validated; all 3 constituencies queryable with population, ward, issue_type data
2–3	FastAPI skeleton + WhatsApp webhook + Aadhaar OTP	Citizen can submit issue via WhatsApp; receives acknowledgment with issue_id
3–4	Intake Agent: extraction + embedding + storage	Issue stored with severity_score, issue_type, embedding vector, constituency mapping
4–5	Clustering Agent: BERTopic + velocity	Top 10 issues per constituency updating

	badges	every 15 min with Rising/Chronic/Tatkal badges
5–6	Question Hour Draft Agent: ministry mapping + question drafting	Agent produces 3 draft questions per constituency per day, mapped to correct ministry, with citizen data citations
6–7	MP Brief Generator: PDF + WhatsApp delivery	Weekly PDF brief with top issues + draft questions deliverable to MP WhatsApp
7–8	Minimal dashboard: map + issue ledger + draft question log	Public URL showing constituency issue ledger and draft questions (read-only, no auth)
8–12	MP co-pilot onboarding + first filing	1 MP partner reviews briefs, selects question, files in Parliament session

11. Legal Posture & Constitutional Authority — NEW

This section did not exist in v1.0. It is the most critical addition. AgentSabha's legal posture determines whether it survives political and regulatory challenge. Every design decision in this section must be reviewed by Indian constitutional and tech law counsel before Phase 2 launch.

11.1 The Core Legal Boundary

AgentSabha is, in all phases, a research and drafting tool — not a participant in Parliament. The constitutional boundary is absolute: only elected Members of Parliament under Articles 81-83 of the Constitution of India may participate in Lok Sabha proceedings. AgentSabha produces drafts that MPs may choose to use; it does not file, submit, or speak in Parliament under its own authority.

What AgentSabha IS legally	What AgentSabha is NOT legally
A civic research and intelligence platform	A Member of Parliament or parliamentary participant
A tool that produces draft parliamentary instruments for MP review	An entity with any right to file questions, motions, or bills
A publisher of civic analysis and data	A political party, lobby group, or election participant
A technology intermediary under IT Act 2000	A government body or constitutional authority
A platform where citizens submit issues voluntarily	A mandatory or official government grievance mechanism

11.2 IT Rules 2021 — Grievance Officer Requirement

Under Information Technology (Intermediary Guidelines and Digital Media Ethics Code) Rules 2021, any 'significant social media intermediary' (>5M users) must appoint a resident Grievance Officer. AgentSabha must plan for this from Phase 2 onwards as user base crosses thresholds.

The 'no human editorial interference' principle is preserved under this structure. The Compliance Officer has authority to pause the pipeline for legal violations (court order, CERT-In directive) only — not to change editorial content selection.

Role	Authority	Limits on Authority
Grievance Officer (India-resident, named)	Respond to user complaints within 72 hours; receive court/government orders	Cannot change political content selection; cannot instruct agents on issue framing; cannot suppress specific constituencies
Legal Compliance Officer	Pause pipeline if court order received; respond to CERT-In directives	Must document every pause with reason; pipeline auto-resumes after legal resolution unless court order is ongoing
Technical Safety Officer	Override Fact Check Agent if hallucination passes gate; technical kill-switch	Content kill-switch only — no political editorial authority whatsoever

Editorial Independence	No human has authority to change which issues are covered, which perspectives are presented, or which constituency data is published	This separation is the product's credibility guarantee — documented and public
-------------------------------	--	---

11.3 Aadhaar & UIDAI Constraints

Aadhaar-based authentication is powerful but heavily regulated under the Aadhaar (Targeted Delivery) Act 2016 and UIDAI guidelines. AgentSabha cannot store Aadhaar numbers. It can use OTP-based authentication for constituency verification only — not for identity storage or commercial data products.

Constraint	What is Permitted	What is Prohibited
Storage	Store Aadhaar-linked token (VID) only — never the Aadhaar number itself	Storing Aadhaar numbers, biometrics, or demographic data from UIDAI
Purpose limitation	Constituency verification: confirming citizen lives in claimed constituency	Using Aadhaar-linked data to build commercial profiles sold to corporates or financial institutions
Data retention	Minimum retention required for verification; delete within 6 months of citizen inactivity	Indefinite retention of Aadhaar-linked records
International transfer	No Aadhaar-linked data may leave Indian servers under any circumstances	Any international data transfer of Aadhaar-linked records
Commercial use	Aggregate, anonymised, non-Aadhaar-linked constituency statistics may be commercialised	Selling any data that could be reverse-linked to individual Aadhaar identity

11.4 DPDP Act 2023 — Digital Personal Data Protection

The Digital Personal Data Protection Act 2023 governs how AgentSabha handles all citizen personal data. Key obligations:

- **Consent:** Explicit, granular consent required for each data processing purpose. Citizens must separately consent to: issue storage, constituency mapping, anonymised aggregation for public dashboard, optional MP brief inclusion.
- **Purpose limitation:** Data collected for constituency verification cannot be repurposed for commercial intelligence products without fresh, specific consent.
- **Data Principal Rights:** Citizens have the right to access, correct, and erase their data. AgentSabha must provide a functional data erasure mechanism from Phase 1.
- **Data Localisation:** All personal data of Indian citizens must be stored on servers physically located in India.
- **Data Protection Board:** Designate a Data Protection Officer (can overlap with Grievance Officer in Phase 1-2) and file required notices with the Data Protection Board once operational.
- **Minor protection:** Citizens under 18 cannot use the platform; age verification must be implemented before Phase 2 scale.

11.5 Blockchain Immutability vs. Takedown Obligations

This is the most technically complex legal conflict in the entire architecture. Anchoring session transcripts on Polygon creates immutable public records — which directly conflicts with court-ordered content takedowns and the IT Act's safe harbour requirements.

Resolution: AgentSabha anchors a cryptographic hash of each transcript on-chain — not the transcript content itself. The content is stored on AgentSabha servers (mutable, deletable). The hash proves the content existed at a specific time and has not been tampered with. If a takedown is legally required, AgentSabha deletes the server copy and publishes a notice that the content existed but was removed under legal order. The hash remains on-chain as a permanent record of the deletion event.

This architecture satisfies both the 'permanent record' principle (hash on-chain proves content existed and when) and legal takedown obligations (server copy is deletable). It is more honest than pure on-chain storage and legally defensible.

11.6 Defamation & Content Liability

AgentSabha's 6-perspective framework and sourced-only content policy significantly reduces defamation risk, but does not eliminate it. All published content must:

- Source every factual claim to a primary source (government data, CAG report, court record, or cited academic research). The Fact Check Agent's hard gate enforces this.
- Never attribute corruption, criminality, or moral failing to a named individual — only report documented facts and official records.
- Clearly label perspectives as the perspective of that stakeholder — not as AgentSabha's editorial position.
- Maintain a pre-publication legal review for any content naming private individuals (not public officials acting in official capacity).
- Carry standard disclaimers on all published content: 'AgentSabha is a research and intelligence tool. This content is based on public records and citizen-submitted data. It does not constitute legal advice or factual findings of wrongdoing.'

12. Governance, Safety & Human Oversight — NEW

AgentSabha's 'no human editorial interference' principle is a credibility guarantee, not an operational reality claim. There must be human oversight at the system level — not the content level. This section defines the governance architecture that preserves editorial independence while maintaining legal accountability, hallucination control, and crisis response capability.

12.1 The Two-Layer Oversight Model

Layer 1: System governance — humans who can pause, fix, or restructure the pipeline. Layer 2: Content independence — no human may change what issues are covered, which perspective is presented for which party, or which constituency's data is prioritised. These two layers must be structurally separated in code and documented publicly.

Action	Who has authority	Who does NOT have authority
Pause the full pipeline (kill-switch)	Technical Safety Officer — only on documented technical failure or court order	Any political actor, investor, MP, or government official
Remove published content	Legal Compliance Officer — only on court order or CERT-In directive with documented reason	Any editorial or business stakeholder
Change which issues are included in weekly analysis	No human — fully algorithmic based on severity × velocity × geographic spread	Anyone
Change which perspectives are researched	No human — 6 perspectives run for every issue, every week, without exception	Anyone
Modify agent prompts or system configuration	CTO with documented change log — no silent changes permitted	Any non-technical stakeholder
Review fact-check failures before publish	Technical Safety Officer — may delay publish, not change content	Anyone
Approve MP brief content	No human — MP brief is machine-generated from constituency data	Any political or commercial stakeholder

12.2 Hallucination Control Architecture

The parliamentary action pipeline does not yet have a hard gate equivalent to the Fact Check Agent in the media pipeline. A malformed or factually incorrect question filed to Parliament cannot be 'unpublished' from the institutional record. This must be fixed before any real parliamentary filings.

Required control gates for parliamentary action pipeline (Phase 2+):

Gate	Where in pipeline	Criteria for pass/fail
------	-------------------	------------------------

Source verification	Before any parliamentary draft is finalised	Every factual claim must link to primary source in agent_logs. No source = claim removed.
Rule compliance check	Before any filing recommendation is generated	Proposed instrument must map to specific Lok Sabha rule. Rule citation required in output.
MP review gate	Before any filing (Phase 1 and Phase 2)	All parliamentary action outputs are drafts for MP approval. No direct filing in Phase 1-2.
Shadow mode simulation	Parallel to real pipeline for 90 days before any change	New agents or major prompt changes run in shadow mode (no real output) before going live.
Constituency data freshness	Before any draft referencing constituency statistics	Data older than 7 days flagged; older than 30 days blocked from use in filings.
Cross-agent consistency	Before MP brief is assembled	Question Hour Agent output must be consistent with Clustering Agent's current top issues. Inconsistency blocks brief generation.

12.3 Bias Audit Framework — Published Weekly

AgentSabha publishes a weekly audit report alongside every episode and brief. This is not just good governance — it is the primary defence against politically motivated bias claims. The audit report contains:

- Geographic balance score: Herfindahl index of constituency representation across the week's issues. Any single state above 25% of total issues is flagged.
- Party representation log: Distribution of issues across BJP-governed, Congress-governed, regional party-governed, and AAP-governed states. Published as percentage breakdown.
- Source citation index: Complete list of every source used in the week's podcast and briefs. Downloadable CSV.
- Fact-check report: Total claims processed, claims verified, claims rewritten, claims removed. Zero unverified claims published.
- Dissent resolution log: All citizen dissent submissions received, agent responses, position changes made.
- Perspective balance check: Confirmation that all 6 perspectives (Citizen, Ruling, Opposition, Expert, Global, Solution) were produced for every issue covered.
- Agent action log: Every parliamentary draft produced, with hash of input data and output text. Publicly auditable.

12.4 Crisis Response Protocol

When a crisis event occurs (viral misinformation claim about AgentSabha, content takedown demand, parliamentary objection, or data breach), the following protocol applies:

Crisis type	Response timeline	Response authority
Viral misinformation	Publish fact-correction	Technical Safety Officer + automated source citation

about AgentSabha content	within 4 hours; link to source audit log	system
Parliamentary objection to agent output	Pause relevant constituency agent; publish explanation of action taken	Legal Compliance Officer + CTO
Court-ordered content takedown	Remove server content within 24 hours; publish deletion notice with hash record	Legal Compliance Officer
Data breach (any personal data)	Notify affected users within 72 hours per DPDP Act; notify Data Protection Board	CTO + Legal Compliance Officer + CEO
Platform suspension (YouTube/Meta)	Activate fallback distribution: AgentSabha.in direct + Telegram + WhatsApp broadcast	Technical Safety Officer
Political pressure to change coverage	Publish the pressure publicly; do not comply; document in weekly audit log	CEO — with board notification

13. Security, Privacy & Adversarial Threat Model — NEW

AgentSabha's data is uniquely high-value and high-risk: Aadhaar-linked citizen profiles, real-time constituency issue patterns, aggregated political sentiment, and pre-publication parliamentary drafts. A breach in a high-stakes political context is not just a technical incident — it is a political crisis that ends the project. Security must be designed as a first-class architectural concern, not a Phase 3 addition.

13.1 Data Classification Tiers

Tier	Data Type	Access	Monetisation Permitted
Tier 0 — Raw PII	Aadhaar VID tokens, mobile hashes, citizen-constituency links	Internal only — encrypted at rest and in transit; no external access	Never — not under any circumstances
Tier 1 — Issue Content	Raw issue text, translated text, embeddings	Internal only — issue text never externally exposed; embeddings internal	Never in identifiable form
Tier 2 — Aggregated Clusters	Issue cluster labels, category counts, severity averages, velocity scores per constituency	Public dashboard (anonymised aggregates only)	Yes — as non-identifiable constituency intelligence
Tier 3 — Parliamentary Drafts	Draft questions, Zero Hour notices, bill text	MP (for their constituency) + public after MP filing	Draft pipeline: MP only. After filing: fully public.
Tier 4 — Media Outputs	Podcast, Reels, Twitter threads, press packages	Fully public	Yes — media revenue, journalist API subscriptions
Tier 5 — Audit Logs	Agent action logs, fact-check reports, bias audits	Fully public	Open access only — these are the credibility asset

13.2 Adversarial Threat Model

AgentSabha's adversaries are not primarily external hackers — they are politically motivated actors with sophisticated resources. The threat model must be designed for state-level and party-level adversaries, not just commodity cybercriminals.

Threat actor	Attack vector	Potential damage	Mitigation
Political party	Coordinated submission flooding: 10,000+ supporters submit identical issues to manipulate constituency rankings	Artificial issue velocity; manufactured parliamentary priorities	Aadhaar dedup (1 submission/citizen/cluster); velocity anomaly detection; public auditability of all submissions
Political party	Deanonymisation attack on embeddings: using published issue clusters + external data to identify individuals	Exposure of citizen identity; chilling effect on participation	Differential privacy noise added to all published aggregates; minimum cluster size of 50 before publication

State-level actor	Pressure on Aadhaar/UIDAI to revoke API access	Collapse of identity verification system; loss of constituency mapping	Fallback: mobile OTP + civil society physical verification at Jan Sunvaai camps
Competitor / opponent	Insider attack: staff member with API key leaks pre-publication MP briefs	Advance knowledge of parliamentary strategy; breach of MP trust	Role-based access control; no single person has access to all 543 MP briefs; all access logged
State-level actor	Server seizure or infrastructure blocking	Platform goes offline; data exposed	Data residency in India (DPDP-compliant); multi-cloud with Indian providers; offline-first WhatsApp fallback
Organised troll campaign	Mass false dissent submissions to force agents to change positions	Erosion of citizen trust in agent neutrality; manufactured 'position changes'	Dissent threshold requires verified Aadhaar accounts; rapid-onset dissent anomaly detection; all dissents public

13.3 Minimum Security Requirements by Phase

Requirement	Phase 1 (must have)	Phase 2+ (must add)
Encryption at rest	AES-256 for all Tier 0-1 data	HSM-based key management; quarterly key rotation
Encryption in transit	TLS 1.3 for all API calls	Certificate pinning for WhatsApp Business API
Access control	Role-based; no shared credentials	Zero-trust architecture; MFA on all internal systems
Audit logging	All Tier 0-1 data access logged with timestamp and actor	Immutable audit log stored separately from application database
Penetration testing	Before Phase 2 launch (third-party)	Annual third-party pen test; bug bounty programme
Incident response plan	Document before first citizen onboarded	Test quarterly; include state-level scenario drills
Data residency	All servers in India from day one	Multi-AZ within India; no data egress to international cloud regions
Aadhaar compliance	UIDAI-approved AUA/KUA enrolment before launch	Annual UIDAI compliance audit

14. Phase 1 Narrative & Success Story — NEW

This section describes what Phase 1 should look and feel like when it is working. Not metrics. Not architecture. The actual story that proves the concept to MPs, journalists, and eventual funders.

14.1 The Target Story — Phase 1 Done Right

"Ramesh Kumar, a farmer in Amethi constituency, submitted a voice note in Bhojpuri on WhatsApp: his village road had been washed out for three monsoons. AgentSabha's Intake Agent transcribed it, translated it, and clustered it with 214 similar complaints from the same taluk. By Friday morning, the constituency agent had drafted a specific, cited, Rule 32-compliant starred question to the Ministry of Road Transport asking why NH-56 contract KA-2021-447 had not been completed in three years, citing the cluster of 214 complaints, two CAG audit findings, and the ministry's own response to an RTI filed by a local journalist. The local MP, who had subscribed to the AgentSabha co-pilot, reviewed the brief over Saturday breakfast, made one edit to the preamble, and filed the question on Monday. Three weeks later, the Ministry responded. The response was published on the public AgentSabha dashboard. Ramesh received a WhatsApp notification: 'Your issue was raised in Parliament. The Ministry has responded. Here is what they said.'"

That story, documented and published, is AgentSabha's Phase 1 success. Not 1,000 users. Not a dashboard. Not a GitHub repo. One citizen, one cluster, one MP, one question, one parliamentary response, one notification. The entire loop, end to end, once.

14.2 What Makes a Good Phase 1 Constituency

Criteria	Why it matters	Example type
MP who is independently motivated to use data	The co-pilot model only works if the MP engages; a hostile or indifferent MP makes Phase 1 impossible	First-term MP, tech-literate, opposition or independent (less party-whip pressure to not engage)
High issue density in one category	You need enough cluster signal to produce a compelling draft question; sparse data produces weak questions	Urban constituency with known infrastructure backlog, or rural with documented water/road crisis
Active civil society partner for citizen onboarding	Cold WhatsApp submission volumes will be very low without someone trusted encouraging submissions	NGO, Jan Suvidha Kendra, or local journalist with existing citizen trust
No active political crisis	You don't want Phase 1 to be associated with a constituency that is a political battleground	Avoid swing constituencies in upcoming state elections or constituencies with active criminal cases against MP
Accessible MP staff	You need someone in the MP's office who actually reads the brief and surfaces it to the MP	Research-oriented MP staff or intern programme connection

14.3 The Phase 1 Pitch to an MP

When approaching a potential MP co-pilot partner, the pitch must be short, specific, and not threatening:

"Your constituency has 2.7 million people. Your staff has 5 people. Every week, AgentSabha will deliver you a one-page brief: the top 5 issues your constituents reported this week, ranked by how many people reported them and how critical they are, with a draft parliamentary question already written and ministry-mapped for each. You can edit it, ignore it, or file it. We ask for nothing in return except the right to publish that a question was filed. In 90 days, your question count will be higher than 90% of MPs in your state. Your constituents will be able to see that."

14.4 Phase 1 Exit Criteria

Phase 1 is complete — and Phase 2 is authorised to begin — when ALL of the following are true:

- 1 MP has filed at least 1 parliamentary question directly derived from AgentSabha citizen cluster data in a real Lok Sabha or Zero Hour session.
- The citizen whose issue triggered the cluster has received a WhatsApp notification confirming the question was filed.
- At least 1 national publication has written about the co-pilot model with the specific loop documented (citizen → cluster → draft → MP files → response).
- The public dashboard is live and shows real issue data for at least 3 constituencies.
- The Fact Check Agent has maintained a 100% verified-claims record on all MP briefs produced.
- A security audit has been completed and critical findings resolved before Phase 2 begins.
- Legal counsel has reviewed and approved the IT Rules 2021 compliance structure and DPDP consent framework.
- At least one civil society organisation has formally endorsed the platform in writing.

14.5 What Phase 1 Does NOT Need to Build

Scope discipline in Phase 1 is as important as what you build. Every item below is a real and valuable feature. None of them should be built in Phase 1.

- Full 543-constituency deployment — 3 constituencies is enough to prove the loop
- Zero Hour Agent, Debate Agent, Bill Drafting Agent — these require Phase 2 MP trust
- Autonomous media engine (podcast, Reels) — no audience yet; no data density yet
- Journalist API — no paying customers until you have demonstrated value
- Any revenue stream — trust before money
- Vidhan Sabha or international deployment — prove India first
- Speaker Agent — no multi-agent parliament coordination until single-constituency co-pilot is proven
- Financial sector or election intelligence products — these come after civic trust is established
- Mobile app — WhatsApp first; every rupee spent on an app in Phase 1 is a rupee taken from the core loop
