

AGENTSABHA

Phase 1 Tactical Execution Plan

The One MP · One Constituency · One Question Hour Loop

Document	Classification	Timeline	Team Size
AgentSabha Phase 1 Plan	Internal — Founding Team	8 weeks to demo 12 weeks to first filing	2–3 engineers + 1 BD

The goal of Phase 1 is not to build a platform. It is to prove one loop: citizen submits issue → AI clusters → MP gets draft → MP files in Parliament → citizen receives notification. Once. In public. With a real MP. That loop, documented, is worth more than 100 slides to every investor, journalist, and government official who sees it.

1. The Phase 1 Loop — Defined Precisely

Phase 1 has one job. This is the loop:

Step	Actor	Action	Output	Success signal
1	Citizen	Submits issue via WhatsApp in any Indian language	Issue received, issue_id generated, acknowledgment sent	Citizen receives 'Your issue has been registered as #AS-001' WhatsApp reply within 60 seconds
2	Intake Agent	Transcribes, translates, extracts issue_type / severity / location, generates embedding	Structured issue record in database with 1536-dim embedding	Record stored with severity_score, constituency_id, ward, ministry_mapping
3	Clustering Agent	Runs every 15 min; groups issue with similar reports; calculates velocity	Cluster updated; badge assigned; Top 10 ledger refreshed	Citizen's issue appears in constituency Top 10 within 15 minutes of submission
4	Question Draft Agent	Reads top cluster; identifies responsible ministry; drafts Rule 32-compliant question with citations	Draft starred or unstarred question with source citations and constituency data	Draft question produced citing ≥2 primary sources; mapped to correct ministry
5	MP Brief Generator	Assembles weekly 1-page brief: top 5 issues + 5 draft questions + severity scores	PDF brief + WhatsApp message	MP receives brief every Friday by 9am IST
6	MP (Human)	Reviews brief; edits if needed; files selected question in Parliament	Real parliamentary question filed under MP's name	Question appears in Lok Sabha bulletin or Zero Hour record
7	Response Monitor	Polls parliamentary records for ministry response to filed question	Ministry response captured and stored	Response logged with timestamp
8	Citizen Notification	Identifies citizen(s) whose cluster triggered the question	WhatsApp notification to citizen	Citizen receives: 'Your issue was raised in Parliament. Ministry replied: [summary]'

Every step in this loop must work before Phase 2 begins. You do not need 543 constituencies. You do not need a podcast. You need this loop to complete once, with real data, with a real MP.

2. Constituency Selection — How to Choose 3

The 3 Phase 1 constituencies determine whether the loop can actually be proven. Wrong constituency choices — unresponsive MP, sparse issue data, no civil society partners — make Phase 1 impossible to complete regardless of technical quality.

2.1 Selection Criteria (Must-have vs. Nice-to-have)

Criterion	Must-have	Nice-to-have	Disqualifier
MP engagement	At least 1 confirmed MP willing to review weekly briefs and file at least 1 question	MP publicly interested in tech/civic innovation	MP who is a minister (ministers don't file questions), MP facing election in <6 months
Issue density	Constituency has documented, persistent infrastructure issues (roads, water, power, health) with existing citizen complaints accessible	Issue already in media/RTI record	Constituency with no data signal — no NGO presence, no civic activity, no media coverage
Civil society partner	At least 1 NGO, Jan Suidha Kendra, or local journalist willing to encourage citizen WhatsApp submissions	Partner with existing WhatsApp group infrastructure (500+ members)	No civil society presence at all
Geographic diversity	At least 1 urban (metro/Tier 1), 1 semi-urban (Tier 2-3 town), 1 rural	Geographically distinct states	All 3 in same state (limits the proof of geographic scalability)
Language coverage	Hindi and at least 1 other regional language represented across 3 constituencies	Constituency with strong voice note culture on WhatsApp	All 3 constituencies same language (limits IndicTrans2 proof)
Political safety	Constituency not currently a political flashpoint or subject of active litigation	First-term or independently-minded MP	MP under ED/CBI investigation; constituency with active communal tension

2.2 Recommended Constituency Profile Mix

Slot	Profile	Rationale	Example type
Constituency A — Urban Anchor	Thiruvananthapuram, Kerala — India's most literate city, 94% literacy rate, 74% urban electorate	Shashi Tharoor (INC) is the ideal MP partner — opposition, tech-forward, 4th consecutive term, will publicly champion AgentSabha	Best overall Phase 1 constituency: best MP, highest digital literacy, real CAG-documented coastal issues, Kerala WhatsApp penetration is highest in India

Constituency B — IT Capital	Bengaluru South, Karnataka — BTM Layout, Koramangala, Jayanagar; India's startup capital	Highest citizen submission volume — tech workers on WhatsApp; massive RWA apartment networks already active	Even if MP (Tejasvi Surya, BJP) is cautious, data density from Bengaluru South proves platform aggregation at scale
Constituency C — NCR Media Story	Gurugram, Haryana — Fortune 500 offices next to sectors that flood every monsoon; India's IT corridor	Best media story in India: rich city, broken civic infrastructure; Delhi press corps 30 min away	Gurugram RWA Federation (100+ RWAs) is ready-made civil society partner; ₹400Cr+ drainage investment CAG-flagged

2.3 How to Find the MP Partner

The MP partner is the single most critical Phase 1 variable. The right approach:

- Target first-term MPs: they are more likely to be looking for differentiation tools; they have lower staff capacity; they are more receptive to outside help.
- Target opposition MPs in BJP-governed states (or vice versa): they have stronger incentive to use parliamentary questions as accountability tools and less party-whip pressure to avoid transparency.
- Target MPs who have publicly spoken about constituency service, tech-for-governance, or parliamentary reform — there are 30-40 such MPs identifiable from PRS and media records.
- Use the civil society partner as the introduction: an NGO that the MP already trusts is a far stronger introduction than cold outreach.
- The pitch is one page, not one deck. See Section 5 for the exact MP pitch script.
- Offer a 90-day free pilot. No contract needed for Phase 1. Just commitment to review the weekly brief and file at least one question if a good one is generated.

3. 8-Week Build Plan — Week by Week

This is a 2-engineer plan. Do not hire a 10-person team for Phase 1. 2 strong full-stack engineers who understand the product can ship this in 8 weeks. A larger team will spend 8 weeks in planning meetings.

Week 1–2: Foundation

Task	Owner	Definition of Done	Dependency
PostgreSQL schema + pgvector + Alembic migrations	BE Engineer	All tables created; migrations run clean; seed data for 3 constituencies loaded with census + ward data	None
FastAPI project skeleton + health checks + error handling	BE Engineer	GET /health returns 200; all planned endpoints return 404 with correct schema; Sentry connected	Schema done
WhatsApp Business API account setup + webhook	BE Engineer	Meta Business account verified; webhook receives test message; stores raw payload in DB	None (parallel)
Aadhaar OTP integration (UIDAI AUA enrolment application)	BE Engineer	UIDAI application submitted; test OTP flow working in sandbox; VID storage confirmed (no Aadhaar number stored)	Legal review of UIDAI terms
Next.js project setup + basic constituency map	FE Engineer	Page loads; India TopoJSON renders 3 highlighted constituencies; no data yet	None (parallel)

Week 3–4: Intake Agent

Task	Owner	Definition of Done	Test
WhatsApp message handler: text + voice note routing	BE Engineer	Text messages processed; voice notes downloaded from Meta CDN; stored with media_url	Send 20 test messages in 5 languages; all stored correctly
Whisper integration for voice transcription	BE Engineer	Voice note transcribed to text within 10 seconds; stored alongside original	Test with Malayalam, Kannada, Hindi voice notes
IndicTrans2 translation pipeline	BE Engineer	Non-English text translated to English with source language tagged; Hindi passthrough	Test 10 languages; verify quality against human translation for 3 languages
LLM extraction: issue_type, severity, location, urgency	BE Engineer	Claude Haiku extracts structured fields; severity 1-10 scored; JSON stored in issues table	100 synthetic test issues across all 3 constituency types; manual review of extraction quality
Embedding generation +	BE	1536-dim embedding stored for	Test similarity search:

pgvector storage	Engineer	every issue; cosine similarity search returns relevant issues in <500ms	'road pothole' returns similar road issues
Citizen acknowledgment: issue_id + rank notification	BE Engineer	Citizen receives WhatsApp reply within 60 seconds with issue_id and current rank in constituency	End-to-end test: submit issue, receive acknowledgment within SLA

Week 5: Clustering Agent

Task	Owner	Definition of Done	Test
BERTopic pipeline on constituency issues	BE Engineer	Topics generated from embeddings; cluster_id assigned to each issue; runs every 15 min via Celery	Seed 200 issues per constituency; verify clusters make semantic sense
Velocity calculation: week-over-week change	BE Engineer	Velocity score computed per cluster; stored in cluster_snapshots; Rising/Chronic/Tatkal badges assigned	Inject synthetic velocity spike; verify Tatkal badge triggers at correct threshold
Top 10 issue ledger per constituency	BE Engineer	Top 10 clusters per constituency queryable via API; updates within 15 min of new submissions	API response matches manual count of issues by cluster
Cross-constituency pattern detection	BE Engineer	If identical cluster appears in all 3 constituencies simultaneously, national_flag set on cluster	Inject same issue type across all 3; verify flag triggers
Ministry mapping lookup table	BE Engineer	All issue_types mapped to responsible ministry; mapping table seeded and queryable	Manual review of all 50+ issue types mapped to correct ministry

Week 6: Question Draft Agent

Task	Owner	Definition of Done	Quality Gate
Ministry mapping + rule lookup RAG	BE Engineer	Lok Sabha Rules 32-55 loaded in RAG; ministry-function table queryable; agent can cite specific rule for each question type	Test 20 issue types; verify rule citation and ministry mapping correct in all 20
Starred question drafter	BE Engineer	Produces Rule 32-compliant starred question with: specific ask, constituency data cited, ministry named, citizen evidence referenced	Human review of 10 generated questions; minimum 8/10 rated 'could be filed by an MP'
Unstarred question drafter	BE Engineer	Produces unstarred question requesting specific data/report from ministry; citable sources only	Human review of 10 generated questions; zero unverified factual claims

Source citation requirement — hard gate	BE Engineer	Question cannot be finalised if any factual claim lacks a primary source citation; claim is removed if no source found	Inject unsourced claim into test data; verify it is removed before question is output
Draft question storage + versioning	BE Engineer	All draft questions stored with cluster_id, source citations, generation timestamp, model version	Verify question can be linked back to originating cluster and citizen issues

Week 7: MP Brief + Dashboard

Task	Owner	Definition of Done	Test
Weekly PDF brief generator	BE Engineer	1-page PDF produced every Friday: top 5 issues, severity scores, 5 draft questions with sources, comparison vs national average	Generate brief for all 3 constituencies; human review for quality and accuracy
WhatsApp Business API brief delivery	BE Engineer	PDF + summary message sent to registered MP WhatsApp number by 9am IST every Friday; delivery confirmed	End-to-end test with test phone number; verify receipt and PDF opens correctly
Public constituency dashboard	FE Engineer	Issue ledger shows top 10 issues with category, severity, velocity badge; draft question log visible; updates in real time	Load 3-constituency dashboard on mobile and desktop; verify map, ledger, and question log render correctly
Constituency map with heat overlay	FE Engineer	3 constituencies highlighted on India map; click opens constituency detail; severity-based colour coding	Test on both Android Chrome and Safari iOS — India's dominant mobile browsers
Issue submission web form (backup to WhatsApp)	FE Engineer	Web form accepts issue text + constituency selection; submits to same pipeline as WhatsApp; Aadhaar OTP verifies	End-to-end: submit via web form; verify stored identically to WhatsApp submission

Week 8: Integration, Testing & MP Onboarding

Task	Owner	Definition of Done	Gate
End-to-end integration test	Both engineers	Full loop: citizen submits → clustered → draft question generated → brief produced → deliverable to MP	10 synthetic citizens across 3 constituencies; full loop completes within SLA for all 10
Load test: 15-min clustering SLA	BE Engineer	Clustering pipeline completes for 3 constituencies within 15 min with 1,000 simultaneous issues	Inject 1,000 issues in 1 minute; verify clustering completes within 15 min
Security review: Tier 0-1 data	Both engineers	Aadhaar VID encrypted at rest; no plaintext PII in logs; role-based	Manual security checklist from FRD v2.0 Section

		access verified	13; sign off before MP onboarding
MP co-pilot onboarding material	BD	1-page brief for MP, 1-pager for MP staff, WhatsApp number for brief delivery collected	MP has received test brief; MP staff know how to forward question to filing team
Civil society partner onboarding	BD	Partner has shared AgentSabha WhatsApp number with their community; first 10 citizen submissions received	10 real (not synthetic) citizen submissions from target constituency in database

4. The Exact First Question — What It Should Look Like

This section describes what the first AgentSabha-derived parliamentary question should look and feel like. This is the artefact that proves Phase 1. It should be frameable, publishable, and citable.

4.1 Anatomy of a Perfect Phase 1 Question

The question must be specific enough to be unanswerable with a vague response. 'What has the government done about roads?' is worthless. 'Will the Minister of Ports, Shipping and Waterways inform the House of the current status of the Thiruvananthapuram coastal protection and road restoration works under contract KL-2021-114, awarded in August 2021, with a scheduled completion of March 2023, now 18 months overdue, given that 189 verified citizens from Thiruvananthapuram constituency have reported the Vizhinjam coastal road as completely impassable due to sea erosion, causing documented disruption to the livelihoods of fishing families in 4 coastal villages?' — that is a question.

Element	What the agent must produce	Why it matters
Specificity	Named project, named contract, named timeline, named ministry unit	Forces a specific response; cannot be deflected with general statement
Citizen evidence	'X verified citizens from [constituency] have reported [specific issue]'	Makes the citizen data the foundation; not just AI opinion
Statutory hook	'...in contravention of [specific scheme] guidelines / CAG finding / RTI response'	Creates an accountability anchor; gives media a story angle
Specific ask	'Will the Minister state: (a) current status, (b) revised completion timeline, (c) reasons for delay, (d) penalty action taken against contractor'	Forces structured answer; multiple sub-parts are harder to dodge
Rule compliance	'To be asked under Rule 32 of Lok Sabha Rules of Procedure — Starred'	Ensures it is procedurally admissible; Speaker cannot reject on technical grounds
Source citations	Every factual claim linked to: CAG report, RTI response, government scheme document, or ministry's own press release	Fact Check Agent hard gate; everything in the question must be sourced

4.2 The Moment That Matters — Citizen Notification

The moment that proves AgentSabha to the world is not the question being filed. It is the citizen receiving the notification. This WhatsApp message is what gets screenshot and shared. Design it carefully:

AgentSabha ✓ Namaste [first name]! Your issue about the road in your area has been raised in Parliament. ✓ Question filed by: [MP Name], [Constituency] MP 📝 Question: [One-line summary] 🏛️ Session: Winter Session 2025, Question No. [X] 📄 Ministry response: "[2-sentence summary of response]" Your voice was heard. ✓ To see the full parliamentary record: agentsabha.in/q/[id]

This notification is the product. Not the technology. Not the dashboard. Not the agent taxonomy. The moment Priya in Vizhinjam receives this message and screenshots it to her fishermen's WhatsApp group — that is when AgentSabha becomes real.

5. The MP Pitch — Exact Script

The MP pitch must be delivered in person or via a trusted intermediary. Cold email does not work for this. The pitch is under 3 minutes. This is the script:

5.1 The 3-Minute In-Person Pitch

"[MP Name], I want to show you something. Your constituency has 2.7 million people. Your office has [X] staff. Every week, AgentSabha delivers you a one-page brief: the top 5 issues your constituents reported this week, ranked by how many people said the same thing and how critical it is — roads, water, health centres, power. With it: a draft parliamentary question for each issue, already written, already ministry-mapped, already citing CAG reports and RTI data that support your ask." "You don't have to use it. You can edit it, ignore it, or file it as-is. We ask for nothing except the right to say, publicly, that a question was filed. In 90 days, your question count will be higher than 90% of MPs in your state. More importantly, your constituents will be able to see on our public dashboard that their issues were raised." "I am not asking for a contract, a budget, or a commitment. I am asking for 30 minutes on a Friday morning to show you the brief. If it is not useful to you after 4 weeks, we stop. If it is useful, we talk about next steps."

5.2 Handling Objections

Objection	What they're really worried about	Response
'This is AI taking over Parliament'	Fear of being replaced or made irrelevant	'AgentSabha produces drafts. You decide what gets filed. You get the credit. The technology is invisible — your name is on every question.'
'What if the AI gets something wrong?'	Reputational risk from a bad question	'You review every question before filing. Nothing goes out without your approval. The Fact Check Agent removes every unverified claim. You are the last gate.'
'Who funds this? What's the agenda?'	Political bias concern	'We publish every source for every claim. Our 6-perspective framework covers your party's position AND the opposition's. We have no political alignment. The data comes from your own constituents.'
'My party will not like this'	Whip concern / party discipline	'The questions are based on your constituency's actual issues — potholes, water, hospitals. No party can argue against an MP asking about roads in their own constituency.'
'How is my constituent data protected?'	Privacy and data security	'No names are shared — ever. Issues are aggregated across dozens or hundreds of reports. We are DPDP-compliant. Aadhaar is used only to verify constituency; we never store Aadhaar numbers.'
'What do you get out of this?'	Business model suspicion	'Phase 1 is free. We are building proof that this works. If it works, MPs who used it first become the story. We build the platform. Everyone benefits.'

5.3 The Leave-Behind (1 Page)

The one-page leave-behind for the MP and their staff should contain exactly:

- Header: AgentSabha — Your Constituency Co-Pilot
- 3 sentences on what AgentSabha does (citizen issues → AI clusters → draft questions → MP files → citizen notified)
- One example: a real or realistic question the agent would have drafted for their constituency based on public data
- 3 numbers: average MP questions per term (200) vs AgentSabha target (2,500+); average debate participation (45) vs target (every relevant debate); PMBs filed by 73% of MPs (zero)
- One ask: 'Try the weekly brief for 4 weeks. No contract. No commitment.'
- One contact: founder's WhatsApp number and email
- One URL: constituency dashboard (show their constituency on it before the meeting)

6. Week 12 — Demo Day Checklist

By the end of Week 12, AgentSabha should be able to demonstrate the complete Phase 1 loop live. This is the checklist for Demo Day readiness:

6.1 System Demo Checklist

Demo element	What to show	Pass criteria
Live citizen submission	Audience member submits issue via WhatsApp in their language	Acknowledgment received within 60 seconds; issue appears on dashboard within 5 minutes
Issue clustering	Show the constituency dashboard updating live	Top 10 ledger reflects new submission; cluster badge correct; velocity updating
Draft question generation	Show the Question Draft Agent output for top issue	Question is specific, sourced, ministry-mapped, rule-cited; human reviewer rates it as 'fileable'
MP brief	Show last Friday's MP brief for a target constituency	1-page PDF with top 5 issues + 5 draft questions; WhatsApp delivery timestamp confirmed
Parliamentary record	Show a question that has actually been filed (the Phase 1 proof)	Lok Sabha bulletin entry or Zero Hour record with question derived from AgentSabha cluster
Citizen notification	Show the WhatsApp notification sent to the citizen who triggered the cluster	Screenshot or live demo of the notification message; citizen confirmed receipt
Public dashboard	Show live constituency dashboard	Map + issue ledger + question log visible on public URL without login
Audit trail	Show the agent_log for one question from cluster to draft	Every step logged with timestamp, input hash, output hash, model version

6.2 The Story for Journalists

By Week 12, the story for journalists should be fully documented and shareable. It must answer: Why does this exist? What happened? What changed for a specific person?

The story: 'Priya Nair, a resident of Vizhinjam in Thiruvananthapuram, reported coastal erosion destroying her village road on WhatsApp. She is one of 189 people who reported the same issue. An AI system read all 189 reports, identified the pattern, and drafted a specific question to Parliament. Shashi Tharoor reviewed it on a Friday morning, filed it on Monday. Three weeks later, the Ministry of Ports responded. Priya received a WhatsApp message: her issue had been heard. This is what AgentSabha does — and it can do it for all 543 constituencies in India.'

6.3 Phase 1 Exit Gates — Must ALL Be True

Exit gate	Status to achieve	Verified by
Parliamentary filing	1 question derived from AgentSabha data filed in real Lok Sabha session	Lok Sabha bulletin or official session record
Citizen notification	At least 1 citizen notified of parliamentary action on their issue	WhatsApp delivery receipt + citizen confirmation
Press coverage	1 national publication story on the co-pilot model	Published article with byline and URL
Data quality	100% fact-check pass rate on all MP briefs produced	agent_logs fact_check_report field — zero unverified claims published
Security audit	Third-party security review completed; critical findings resolved	Security firm sign-off document
Legal review	IT Rules 2021 compliance structure and DPDP consent framework reviewed by counsel	Legal counsel sign-off memo
Civil society endorsement	1 civil society organisation has formally endorsed the platform	Written statement or press release from partner organisation
Dashboard live	Public URL showing real data for 3 constituencies	URL accessible without login; data matches database

6.4 If Phase 1 Does Not Complete in 12 Weeks

| *Phase 1 failure modes and how to respond to each:*

Failure mode	Root cause	Response
Cannot find MP partner	Wrong outreach approach; wrong target MPs	Change approach: use civil society as introduction; approach first-term MPs in opposition; consider ex-MP or former minister as honorary advisor first
Citizen submissions too sparse	Insufficient civil society partnership; wrong onboarding approach	Focus on one constituency only; run a Jan Sunvaai camp with partner NGO to get first 50 submissions; WhatsApp group seeding
Draft questions too weak	Insufficient source data for constituency; RAG not working	Spend 1 week manually building the source database for 1 constituency: scrape CAG reports, RTI responses, ministry press releases for that area specifically
MP reviews brief but won't file	MP risk-averse; party pressure	Accept this and document it; find a second MP; publish what the filed question WOULD have been — the transparency is almost as valuable
Technical pipeline fails SLA	Infrastructure underprovisioned	This is solvable with money; upgrade the compute; 15-minute clustering SLA must be met before MP demo

A Phase 1 that takes 16 weeks but completes the full loop with a real MP and real parliamentary record is worth infinitely more than a Phase 1 that runs on time but never gets a question filed. Speed matters less than proof.

7. Team, Budget & Resource Plan

7.1 Phase 1 Team

Role	What they build	Phase 1 cost (12 weeks)	Critical skill
Backend Engineer #1	FastAPI, PostgreSQL, WhatsApp API, Aadhaar OTP, Clustering Agent, Question Draft Agent	₹3–6L (depending on experience)	Python, async FastAPI, pgvector, Redis/Celery, LLM API integration
Frontend Engineer	Next.js dashboard, constituency map, TopoJSON, issue ledger	₹2–4L	React, D3.js, mobile-first CSS, TopoJSON/GeoJSON map rendering
Business Development	MP partner identification, civil society partnerships, journalist relationships	₹2–3L or equity for co-founder	Political network, GovTech experience, NGO relationships in target states
Legal Counsel (part-time)	IT Rules 2021 compliance, DPDP consent framework, Aadhaar UIDAI application, content liability review	₹1–2L (retainer, 3 months)	Indian tech law, Aadhaar Act, DPDP Act, IT Rules 2021
Founder / Product	Product decisions, MP pitch, investor relations, week-by-week prioritisation	Equity only in Phase 1	Civic domain knowledge, product sense, political navigation

7.2 Phase 1 Budget

Budget item	Monthly cost	12-week total	Notes
Engineering salaries	₹3–5L/month	₹9–15L	2 engineers; adjust for equity component
BD / partnerships	₹1–2L/month	₹3–6L	Travel for MP and NGO meetings
Legal (part-time retainer)	₹40–70K/month	₹1.2–2.1L	UIDAI application + DPDP review + content liability
Cloud infrastructure (AWS India)	₹30–50K/month	₹1–1.5L	PostgreSQL RDS + EC2 + Redis; scales up in Phase 2
LLM API costs (Claude Haiku + Sonnet)	₹20–50K/month	₹60K–1.5L	Intake Agent uses Haiku; Question Draft Agent uses Sonnet; estimate 100K issues in Phase 1
ElevenLabs, WhatsApp API, other SaaS	₹15–30K/month	₹45K–1L	Media engine NOT needed in Phase 1; WhatsApp API costs minimal at Phase 1 volumes
Security audit (one-time)	—	₹1–3L	Third-party pen test before Phase

			2 launch
Miscellaneous (travel, events, materials)	₹20–40K/month	₹60K–1.2L	Constituency visits, MP meetings, press demos

Total Phase 1 budget: ₹17–31L (approximately ₹20L median estimate). This is achievable from founder savings, angel investment, or a civic tech grant. Do not raise a large round before Phase 1 exit gates are cleared.

7.3 Phase 1 Funding Sources

- Founder capital: ₹5–10L from founding team to cover first 4 weeks while demonstrating traction
- Civic tech grants: Omidyar Network India, Rohini Nilekani Philanthropies, Azim Premji Foundation, Gates Foundation India all fund civic technology infrastructure
- Angel investors: Individuals with civic / GovTech background — ex-IAS officers, civic entrepreneurs, political scientists who understand the vision
- Social impact accelerators: iSPIRT, NASSCOM Foundation, Bharat Inclusion Initiative — all provide non-dilutive grants or acceleration support for civic tech
- Government schemes: MeitY Startup Hub, TIDE 2.0 — available for Indian civic tech startups with documented social impact
- Do NOT raise from: VCs who will push for fast monetisation before trust is built; political donors of any party; corporate investors with B2G interests in target constituencies
